Abstract.

The purpose of the experiment is to compare the efficiencies of various sorting algorithms including: Bubble Sort, Insertion Sort, Merge Sort, Quick Sort, and a hybrid sorting algorithm called Tim Sort.

1 Introduction

1.1 Problem

The problem is to determine the relative efficiencies of the sorting algorithms.

1.2 Description

Bubble Sort compares adjacent elements and swaps them if they are in the wrong order. Insertion sort place an element in its final sorted position one element at a time. Merge Sort is a recursively divides an array into subarrays, sort the subarrays, and combines the subarrays to form the sorted array. Quick sort recursively selects a pivot point in arrays and organizes the elements less and greater than the partition into respective subarrays and combines the subarrays to form the sorted array. Tim Sort is a combination of Merge Sort and Insertion Sort.

2 Methods

Each algorithm is tested against three different types of arrays of 12,000 elements for 6 trials. The three types of arrays include arrays of random order, arrays in reverse order, and arrays that are “almost” sorted (containing 5-10 inversions).

Trials Run for Each Algorithm

| | # of Trials |
|------------------|-------------|
| Bubble | 6 |
| Insertion | 6 |
| Merge | 6 |
| Quick | 6 |
| Tim | 6 |

The average of the data for each algorithm is calculated using the following equation/

$$A = \frac{\sum_{n=1}^N x_n}{N}$$

Where x_n is the time elapsed for trial n , N is the total number of trials, and A is the average time for a particular algorithm.

3 Results

Time (ms) for Algorithm to Execute on Array of Random Order

| | 1 | 2 | 3 | 4 | 5 | 6 | AVG |
|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bubble | 195 | 247 | 214 | 257 | 223 | 211 | 991 |
| Insertion | 227 | 200 | 193 | 136 | 165 | 143 | 861 |
| Merge | 6 | 5 | 6 | 7 | 6 | 10 | 15 |
| Quick | 6 | 11 | 5 | 6 | 9 | 6 | 12 |
| Tim | 4 | 13 | 5 | 7 | 7 | 5 | 19 |

Time (ms) for Algorithm to Execute on Array of Reversed Order

| | 1 | 2 | 3 | 4 | 5 | 6 | AVG |
|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bubble | 144 | 127 | 152 | 146 | 150 | 148 | 145 |
| Insertion | 204 | 153 | 165 | 165 | 146 | 134 | 161 |
| Merge | 7 | 5 | 9 | 6 | 7 | 11 | 8 |
| Quick | 154 | 132 | 181 | 144 | 171 | 187 | 162 |
| Tim | 12 | 24 | 29 | 6 | 5 | 5 | 14 |

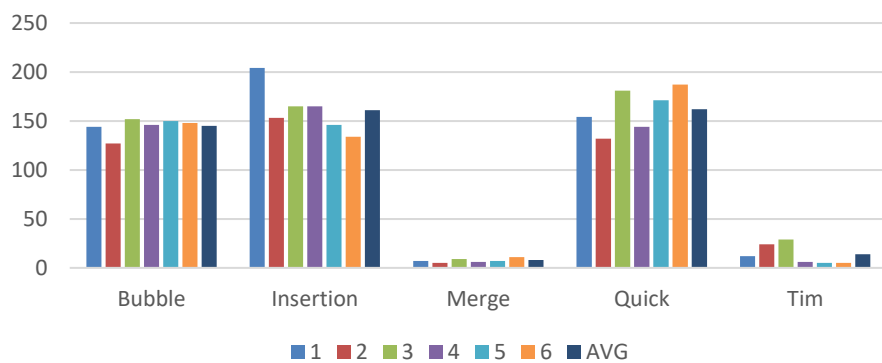

Time (ms) for Algorithm to Execute on “Almost” Sorted Array

| | 1 | 2 | 3 | 4 | 5 | 6 | AVG |
|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bubble | 163 | 128 | 156 | 146 | 155 | 181 | 155 |
| Insertion | 109 | 149 | 160 | 166 | 168 | 164 | 153 |
| Merge | 5 | 6 | 7 | 7 | 8 | 5 | 6 |
| Quick | 307 | 269 | 288 | 293 | 268 | 283 | 285 |
| Tim | 9 | 4 | 12 | 4 | 7 | 5 | 7 |

Time (ms) for Algorithm to Execute on Array of Random Order

Time (ms) for Algorithm to Execute on Array of Reversed Order

4 Conclusion

For an array of randomly sorted elements, Merge Sort, Quick Sort, and Tim Sort are the optimal algorithms. For an array of reverse sorted Merge Sort and Tim Sort are optimal. Quicksort performs worse similarly . For an array of “almost” sorted elements, Merge Sort and Tim Sort are optimal. Quick Sort performs worse than both Bubble Sort and Insertion Sort.
